               Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cc regulating development, modulating cellular processes and preventing confectious disease. NHP nucleotide sequences are useful for gene therapy confectious disease. NHP nucleotide sequences are useful for gene therapy confections and discorders or diseases. NHP oligonucleotides are useful cas hybridisation probes for screening libraries and assessing gene consequences are useful for detecting mutant or consequences are useful for detecting mutant or consequences are useful for detecting mutant or consequences. The polynucleotides and consequences are useful for detecting mutant or consequences are useful for detecting mutant or consequences. The polynucleotides may also be used in screening for drugs effective in the treatment of symptomatic cor phenotypic manifestations of perturbing the normal function of NHP in the body. Nucleotide constructs encoding NHP products are used to constructs encoding NHP products in vivo. These host cells allow for the identification of compounds that bind to NHP creeptors or trigger NHP-mediated pathways.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence represents a novel human protein (NHP) containing a CUB chomain (an extracellular domain). CUB proteins have been associated with regulating development, modulating cellular processes and preventing infectious disease. NHP nucleotide sequences are useful for gene therapy of physiological disorders or diseases. NHP oligonucleotides are useful as hybridisation probes for screening libraries and assessing gene patterns. NHP nucleotide sequences are useful for detecting mutant or inappropriately expressed NHPs (for example, those proteins associated with obesity, high blood pressure, connective tissue disorders and infertility) for the diagnosis of a disease. The polynucleotides may also be used in screening for drugs effective in the treatment of symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. Nucleotide constructs encoding NHP products are used to genetically engineer host cells to express such products in vivo. These host cells allow for the identification of compounds that bind to NHP creeptors or trigger NHP-mediated pathways.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
The sequence represents a novel human protein (NHP) containing a CUB domain (an extracellular domain). CUB proteins have been associated with regulating development, modulating cellular processes and preventing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               infectious disease. NHP nucleotide sequences are useful for gene therapy of physiological disorders or diseases. NHP oligonucleotides are useful as hybridisation probes for screening libraries and assessing gene patterns. NHP nucleotide sequences are useful for detecting mutant or inappropriately expressed NHPs (for example, those proteins associated with obesity, high blood pressure, connective tissue disorders and intertility) for the diagnosis of a disease. The polynucleotides may also be used in screening for drugs effective in the treatment of symptomatic or phenotypic manifestations of perturbing the normal function of NHP in the body. Nucleotide constructs encoding NHP products are used to genetically engineer host cells to express such products in vivo. These host cells allow for the identification of compounds that bind to NHP recent or triager with machinery natherways.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; neuropilin-like polypeptide; neuropilin-Hy1; neovascularisation; neurodegenerative disease; Alzheimer's disease; learning; angiogenesis; thrombocytopaenia; memory; platelet; plastic anaemia; antiinflammatory; ophthalmological; paroxysmal nocturnal haemoglobinuria; protzoacide; wound healing; tissue repair; Parkinson's disease; Huntington's disease; amyotrophic lateral sclerosis; Shy-Drager syndrome; trauma; spinal cord; cerebrovascular; stroke; ulcer; immune; infection; multiple sclerosis; human immunodeficiency virus; HIV; autoimmune disorder; dermatological; systemic lupus erythematosus; rheumatoid arthritis; antihyroid; cancer;
                                                      Novel isolated human Neuropilin-Hyl and Neuropilin-Hy2 polypeptides useful for treating neurodegenerative diseases e.g. Alzheimer's disease, and for diagnosing and mapping genetic neuronal defects -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           autoimmune thyroiditis; diabetes mellitus; graft-versus-host disease; myasthenia gravis; autoimmune inflammatory eye disease; gene therapy; nootropic; neuroprotective; vulnerary; anticonvulsant; antiparastitic; cerebroprotective; tranquilliser; virucide; antibacterial; cytostatic;

```
in modulating neuronal growth, regenerative capacity, treating neurodegenerative diseases, learning and memory disorders, diagnosing amapping genetic neuronal defects and degenerative diseases like Alzheimer's disease, for inducing angiogenesis, and neovascularisation and organ growth and development (e.g. the heart). The nervous systems disorders include lesions of central or peripheral nervous systems, including traumatic lesions, ischaemic lesions, infectious lesions, degenerative lesions, lesions associated with nutritional diseases or approximation of the control o
                                                                                                                                                                                                                                                                                                                                                                                                                                                       cancers. The neuropilin-like proteins are useful for regulating cell proliferation, cell differentiation, sell growth factor activity for inducing proliferation of neural cells, regeneration of nerve and brain tissue, for treatment of central and peripheral nervous system diseases, and neuropathies, such as Parkinson's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated neuropilin-like polypeptide including neuropilin-Hyl and neuropilin-Hy2, the full length cDNAs encoding the proteins and the coding regions of the cDNAs. Also included is a nucleic acid array comprising the cDNAs attached to a surface used for detecting full-matches or mismatches to the cDNAs. The genes for neuropilin-Hyl and Hy2 are located on human chromosome 6q21.
                                                                                                                      gene chips and as a DNA antigen.
                                                                                                                                                                                                                                                                                                                        Huntington's disease, amyotrophic lateral sclerosis, to regulate haematopolesis and treat myeloid and lymphoid cell disorders, various anaemias, and platelet disorders, such as thrombocytopaenia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New neuropilin-like polypeptides for diagnosing, preventing and treating neurological conditions and disorders, cancers, and for inducing angiogenesis and neovascularisation
                                                                                   neuropilin-Hyl.
                                                                                                                                                              regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and as a food supplement or molecular weight marker. The cDNAS are useful in gene identification, genome mapping, transgenics, as hybridisation probes, for primer design,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          disorders, neurological lesions, and lesions caused by toxic substances. The neuropilin-like proteins and cDNAs are also useful as markers for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   inducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The nucleic acid array is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the cDNAs. The neuropilin-like proteins and encoding cDNAs are useful

The invention relates to polynucleotides (I) encoding diagnostic and therapeutic (DITHP) polypeptides (II), which include e.g. enzymes, and therapeutic (DITHP) polypeptides (II), which include e.g. enzymes, and treatment involved in growth and development and receptors. (I) and (II) may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate DITHP expression. For example, (I) and (II) may be used to treat disorders associated with decreased polypeptide expression by rectifying mutations or deletions in a patient's genome, that affect the activity of the DITHPs, by expressing inactive proteins or supplementing the patient's own production of them. (I) and (II) may be used to treat diseases, for example, cell proliferative disorder, conclude the continuous deficiency syndrome (AIDS), lymphoma, leukaemia, autoimmune disorders, and respiratory disorders. Additionally, (I) may be used to produce the DITHPs, by inserting the nucleic acids in to a host cell and culturing the cell to express the protein. (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in the content of the cell cannot be used as DNA probes and therefore which patients may be in need of restorative

(II) may also be used as antigens in the production of antibodies against DITHPs and in assays to identify modulators of DITHI expression and activity. The anti-DITHP antibodies and antagonists may also be used to down regulate expression and activity. The anti-DITHP antibodies may also be used as diagnostic agents for detecting the presence of DITHPs in samples (e.g. by enzyme linked immunosorbant assay (ELISA)). AAU19415-AAU19625 represent human diagnostic and therapeutic (DITHP) polypeptides of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated human disease detection and treatment (MDDT) polypeptide (I) selected from a polypeptide having a sequence selected from 254 sequences (ABB51231-ABB51284) given in the specification, a naturally occurring polypeptide comprising a sequence having at least 90% identity to (I) or a biologically active or immunogenic fragment of (I). (I) is useful for screening a compound for effectiveness as an agonist or antagonist, for screening a compound that specifically binds (I) or modulates the activity of (I), and for preparing a polyclonal or monoclonal antibody by hybridoma technology. Nucleic acids (II) (ABQ72449-ABQ72700) encoding (I) are useful for screening a compound for effectiveness in altering expression of a target
                                                                                          proliferative disorder; hepatitis; psoriasis; cancer; AIDS; autoimmune disorder; inflammatory disorder; altergy; multiple sclerosis; rheumatoid arthritis; transgenic; gene therapy; antiarteriosclerotic; hepatotropic; antiinflammatory antipsoriatic; cytostatic; anti-HIV; antiallergic; antianaemic; antiasthmatic: anti-Arthronomics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polynucleotide comprising. Oligonucleotides and antibodies are useful for detecting MDDT in a sample or for assessing toxicity of a test compound, in a diagnostic test for a condition or a disease associated with the expression of MDDT in a biological sample, for detecting (I) in a sample, and for purifying (I) from a sample. A composition comprising (I), an agonist or antagonist is useful for treating a disease or condition associated with decreased or increased expression of functional MDDT. (I) or (II) are useful for diagnosing, treating or preventing disorders associated with aberrant expression of MDDT, where the disorders are selected from a cell proliferative disorder such as arteriosclerosis, cirrhosis, hepatitis, psoriasis, and cancer and an autoimmune/inflammatory disorder such as Albarox as a steriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 allergy, anaemia, asthma, atherosclerosis, gout, multiple sclerosis rheumatoid arthritis. Novel human disease detection and treatment polypeptide, useful in diagnosis, prevention or treatment of cell proliferative disorders arteriosclerosis, cirrhosis and an autoimmune/inflammatory disorder e.g.

Claim 14; Page 603; 618pp; English.

Nucleic acids (II) (ABQ72449-ABQ72700) encoding (I) are useful for a compound for effectiveness in altering expression of a target polynucleotide comprising. Oligonucleotides and antibodies are useful for detecting MDDT in a sample or for assessing toxicity of a test compound, in a diagnostic test for a condition or a disease associated with the expression of MDDT in a biological sample, for detecting (I) in a sample, and for purifying (I) from a sample. A composition comprising (I), an agonist or antagonist is useful for treating a disease or condition associated with decreased or increased expression of functional MDDT.

(I) or (II) are useful for diagnosing, treating or preventing disorders are associated with aberrant expression of MDDT, where the disorders are selected from a cell proliferative disorder such as arteriosclerosis, cirrhosts, hepatitis, psoriasis, and cancer and an autoimmune/inflammatory disorders such as AIDS, Addison's disease. allergy, anaemia, asthma, atherosclerosis, gout, multiple sclerosis or rheumatoid arthritis. (II) are useful for creating knockin humanised animals or transgenic animals to model human diseases, in somatic or germline gene therapy, to generate a transcript image of a tissue or cell type, for detecting differences in the chromosomal location due to translocation or inversion among normal, carrier or affected individuals and as hybridisation probes for mapping naturally occurring genomic The invention relates to an isolated human disease detection and treatment (MDDT) polypeptide (I) selected from a polypeptide having a sequence selected from 254 sequences (ABP51231-ABP51484) given in the specification, a naturally occurring polypeptide comprising a sequence having at least 90% identity to (I) or a biologically active or immunogenic fragment of (I). (I) is useful for screening a compound for effectiveness as an agonist or antagonist, for screening a compound that specifically binds (I) or modulates the activity of (I), and for preparing a polyclonal or monoclonal antibody by hybridoma technology. that for cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match
                                                     The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the
          and thrombolytic activity, cancer diagnosis and therapy, drug screening,
                                utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haer
                                                                                                                                                                                                      Novel nucleic acids and polypeptides, useful such as central nervous system injuries -
                                                                                                                                                                                                                                                                                          Wang
                                                                                                                                                                                                                                                                                                                                                                                                      09-JUL-2000;

        CC the 5602 nucleotide sequences defined in the specification, where the CC oligonucleotide comprises at least 15 nucleotides; or (b) a combination CC of an oligonucleotide comprising a sequence complementary to the CC complementary strand of a polynucleotide which comprises a 5'-end CC sequence and an oligonucleotide comprising a sequence complementary to a CC polynucleotide which comprises a 3'-end sequence, where the CC oligonucleotide comprises a 3'-end sequence, where the CC oligonucleotide comprises a 1 least 15 nucleotides and the combination of CC the 5'-end sequence/3'-end sequence is selected from those defined in CC the 5pecification. The primer sets can be used in antisense therapy and CC in gene therapy. The primers are useful for synthesising polynucleotides, CC particularly full-length cDNAs. The primers are also useful for the CC detection and/or diagnosis of the abnormality of the proteins encoded by CC the full-length cDNAs. The primers allow obtaining of the full-length CDNAs easily without any specialised methods. AAH03166 to AAH13628 and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78333-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activiny, inhibin activity and may be useful in the diagnosis and/or treatment of colors of the polypeptides have the polypeptides activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Xue

                                                                                                                                                                                       The invention relates to human nucleic acids (AA157798-AA161369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous

                                                                                                                                        The invention relates to human diagnostic and therapeutic (dithp)

polynucleotides and their associated polypeptides (DITHP polypeptides).

The sequences of the invention are used in the treatment and diagnosis of cell proliferative disorders (e.g. atherosclerosis, cirrhosis), cancers

(e.g. tumours of the adrenal gland, bone, bone marrow, brain, breast, cervix, kidney, lung, ovary, pancreas, prostate, skin, spleen, testis or thymus), autoimmune/inflammatory disorders (e.g. asthma, bronchitis, psoriasis, osteoporosis), viral infections, bacterial infections, fungal infections, parasitic infections, developmental disorders (e.g. anaemia, epilepsy), seizure disorders (e.g. cerebral palsy, spina bifida), cendocrine disorders (e.g. thrombosis, aneurysm), metabolic disorders (e.g. obesity, diabetes), neurological disorders (e.g. stroke, amyotrophic lateral sclerosis, multiple sclerosis), gastrointestinal disorders (e.g. ulcerative colitis, lysinuria) and transport disorders (e.g. myotonic dystrophy, catatonia, peripheral neuropathy). Sequences ABG59943-ABG60220 represent human DITHP polypeptides of the invention.
